

Project Title

Hospital Management Dashboard with Real-Time Monitoring

Problem Statement

Managing hospital operations manually or through separate systems can be time-consuming and inefficient. Information such as patient records, doctor availability, appointments, bed occupancy, medicine stock, and billing is often scattered across different departments. This makes it difficult for hospital staff to access accurate information quickly and can delay important decisions. A centralized Hospital Management Dashboard can solve this problem by displaying all essential information in one place.

Objectives

- To develop a centralized dashboard for hospital management.
 - To monitor patient, doctor, and appointment details in real time.
 - To track bed availability and medicine stock efficiently.
 - To reduce manual paperwork and improve data accuracy.
 - To provide graphical reports that help administrators make better decisions.
-

Scope

The system is designed for hospital administrators and doctors. It allows users to manage patient records, doctor information, appointments, bed availability, medicine inventory, and billing details. The dashboard provides real-time statistics and reports, making hospital operations easier, faster, and more organized.

Expected Outcomes

- A simple and user-friendly hospital dashboard.
- Quick access to real-time hospital information.
- Improved management of patients, doctors, appointments, and hospital resources.
- Reduced manual work and fewer data errors.
- Better decision-making through reports and visual dashboards.

- Increased efficiency in daily hospital operations.
